

TYPICAL

GK335 SERIES

HIGH SPEED INTERLOCK SEWING MACHINE
INSTRUCTION BOOK
PARTS CATALOGUE

XI'AN TYPICAL INDUSTRIES CO.,LTD.

1.Introduction

Model 335 interlock stitch sewing machine is special equipment suitable for trades of knitwear, under-wear, etc. This series of products is capable of sewing many stitches, for example, plain interlock stitch, fell interlock stitch, collar and band binding stitch.

2.Specification

Sewing speed	Gauge of needles	Needle bar stroke	Adjusting form of differential	Adjusting form of variational feeding	Differential ratio	Lubrication	Needle
6000 r/min	1.4-4.5mm	31(mm)	Lever type	Button type	Max. positive ratio 1:2 Min. reverse ration 1:0.7	With oil pump automatic oil supply	GK16 or UY1 28 DV×63

3.Installation

Referring to the illustration install the machine correctly.

Fix two pieces of supporting board and upper surface of table by increasing or decreasing nut washers.

4. Sewing Speed and Setting Up of Pulley

The highest sewing speed is 6500r.p.m. and ordinary one is 5300r.p.m. However, it is preferable to operate the new machine at 4000r.p.m. in about 200 hours, after which at 4600r.p.m. ordinary speed. This manner will help life of machine to be much longer. Turning direction of pulley (A) is clockwise as well as handwheel (B).

The transmission belt is V type, M series triangle belt.

After putting belt, please recheck the elasticity of belt, there should be 2CM elasticity when pressing the middle of belt lightly.

Pulley is shifted to left side while pedaling.

After fixing of motor in correct position, fit on belt guard cover.

Dia of motor	Sewing speed	
Pulley (d)	50HZ	60HZ
80mm	3600 r.p.m	4320 r.p.m
90mm	4100 r.p.m	5000r.p.m
111mm	5000 r.p.m	

5. Lubrication

5-1 Oil to Be Used

Use sewing machine oil No.18

5-2 Feeding of Oil

Because oil will have been drained completely from machine at shipment, it must be filled in reservoir up to upper line of oil gauge (C).

5-3 Oil Sight Gauge and Check Procedure of Oil Cycling.

Check oil sight gauge everyday before operation and replenish oil if its face is below underline of the gauge. Looking through oil sight top nozzle before operation, observe the flowing of oil
Caution must be made that this regulating screw slot must be positioned between marks. Usually it has been adjusted properly before shipment.

5-4 Exchange of Oil

To keep the machine longer life, oil should be changed completely after the initial use around 200 hours, then change oil 2 or 3 times yearly.

Change of oil shall be made according to the following order:

- a. Remove V belt from motor pulley, then re-move machine head from supporting board.
- b. Remove belt guard.
- c. Remove drain screw (D) and drain oil.
- e. As for replenishment of oil, refer to "Feeding of Oil".

5-5 Cleaning of Filter and Screen.

When the filter is blocked up, the oil supply will be affected. Although there is sufficient oil in oil reservoir, no oil could be spread from the nozzle. In the case, the operator should turn off the machine immediately, clean or exchange the filter. It should be cleaned every four months. As for the remove procedure of oil filter.

5-6 Oil amount adjustment

Open the faceplate, observe the oil baffle plate, it is normal when it drips between 5 seconds and 10 seconds, if it is not normal, please adjust the oil amount as below step:

1. Remove the top cover.
2. Release the nut B.
3. Adjust the direction of Screw A, when the slot of the screw A parallel with the point C, it is the max oil amount, and rotate the screw A in clockwise, until the oil amount is suitable, and lock the nut B.

6. Proper Operation

6-1 Needle to Be Used, Fitting Of Needle and "SP" and "HR" Device.

The machine uses needles of Model GK16, DVx63, B-63, or type of UY128 GAS. These are many sizes of needles, so that suitable size to the nature of sewing materials must be select. Generally, needle of #65 -90 is the standard size for lightweight, medium weight and medium heavy fabrics and #90 for heavy duty.

DVx63	9	10	11	12	13	14
B-63	65	70	75	80	85	90
GK16						

Needle should be set correctly facing their long slot towards operator; mark (X) in fig. 12 shows incorrect setting of needle. While operating machine in high speed, due to the friction occurred between needle and fabric causing stitch skipping, thread broken and the penetrated hole on the fabric will become much bigger, especially when compound thread and fabric are used.

To prevent from occurring above case, the machine is equipped device of needle lubrication. To achieve most efficient effect of these devices, silicon oil should be used. Generally, we suggest using these devices as much as possible and often open the covers of them, checking the oil amount and making feeding of silicon oil in time. If these devices are not necessary, it's better for you to take out felt from the devices and not let the needle tips and thread to touch them.

6-2 Threading

Threading the machine as shown in fig. A.B.C. indicate needle thread, D stand for upper ornamental thread, E presents looper thread.

6-3 Pressure of Presser Foot and Its Adjustment

When pressure regulating screw (B) is turned clockwise, increase the pressure of presser foot; otherwise decrease it. Imperfect feeding or poor stitch will be caused if the pressure of presser foot is not set properly, so that, to keep the pressure of presser foot as weakly as possible under the condition that stitch is uniform.

If the needle doesn't drop into the center of dropping space as the illustration shows, it is necessary to make adjustment. Firstly, to loosen screw (D), and move presser foot (C), to assure the needle drop correctly. Then tighten screw (D) again.

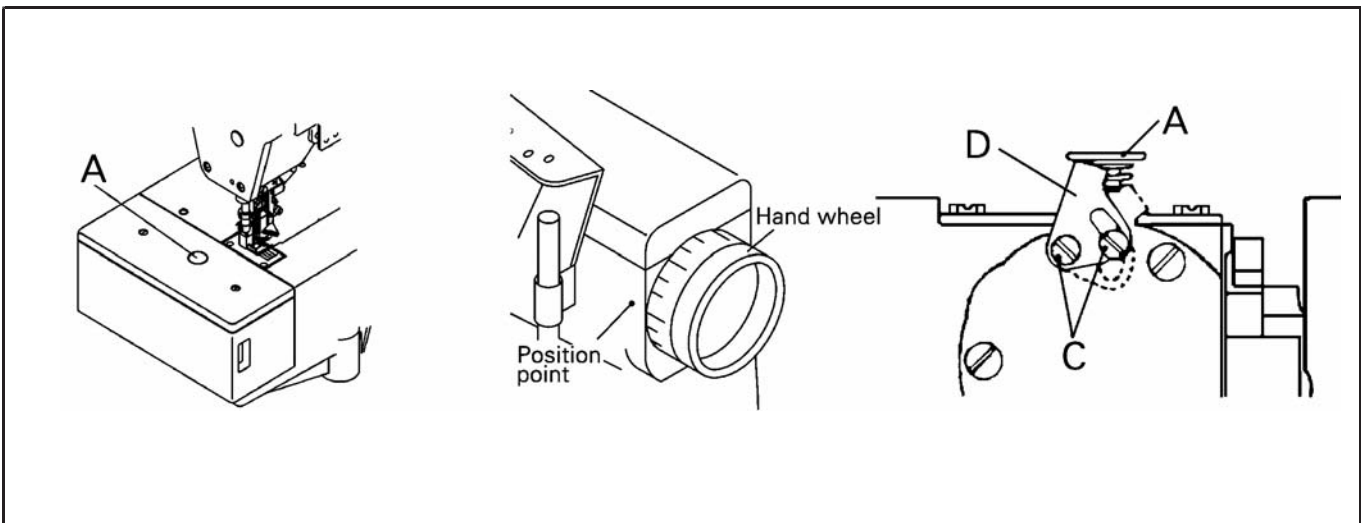

6-4 How to Change Stitch Length

(1) Switch off the Motor Power.

To change the stitch length, press pushbutton (A) softly by left hand until finger feels button top touch parts of machine inside, then turn handwheel by right hand until pushbutton falls in. At this moment, press the pushbutton more strongly and continue to turn handwheel.

(2) Graduation on the circumference of handwheel shows a stitch length in mm.

Turn handwheel by right hand and set any of graduation as desire, the more the graduation "L" close to the orientation-point on arm, the longer the stitch length will be, the more the graduation "S" close to orientation-point, the less stitch length will be. Max. stitch length is 3.6mm and minimum one is 1.4mm.

6-5 Adjusting of Differential Feeding

(1) Normal differential feeding

To make normal differential feeding, loosen screw (A), and set the link lever (B) up and down and fix it at proper position, then retighten screw (A).

When the countermark on the lever is aligned with long graduation line (C) on the graduation plate, main and differential feeding dogs will make equal movement as the ratio is in 1:1 in differential amount, normal differential amount will be increased with lever (B) raising, from "C" above, the ratio will be 1:1.25 1:1.5 1:1.75 and 1:2 successively.

(2) Reverse Differential Feeding When the lever is pressed down under the graduation "C", the machine will be in reverse differential feeding. If graduation "S" is aligned, the differential ratio will be 1:0.7.

(3) Adjusting of differential ratio during sewing

To make adjustment of differential ratio during sewing, the hanger chain can be linked with pedal. When the pedal is treaded after linkage, the differential ratio can be regulated at any time. After loosen screw (F), the range of random differential ratio can be adjusted.

7. Proper Adjusting

Each setting is on the standard position of the machine and no need to be adjusted. Under certain special situation, like to change different needles and hooks, or make some inner adjustment to sew special

7-1 Tension of Needle thread

The distance between needle thread take-up (A) and center of fixing screw (B) is 52mm. When needle lever is at its highest position, edge (A) of needle thread take-up should be horizontal. This is the standard position of the needle thread take-up. After loosen screw (B), move the needle thread take-up towards (Y) direction, tighten needle thread; move it towards (X) direction, loose needle thread. If needle thread tension could not be regulated through above procedure. You'd better loosen screw (C), silicon oil device towards (Y) or (X) direction, and see if the tension is satisfied. Generally, move it towards (Y) direction, tighten the needle thread; move it towards (X) direction, loosen the needle thread.

In case of general sewing condition, the distance between the center of screw and thread eyelet of thread guide should be 8mm.

Sometimes, owing to the different kind of thread nature, it is hard to form thread loop, causing skip of stitch; it's better for you to press the needle thread under small thread pressing plate. Sometimes, the thread loop of left needle is formed too big; it can also be pressed under the small pressing plate.

7-2 Adjusting of Needle Thread Retainer Device

In case of stretchable thread such as synthetic thread is used, needle thread loop will be unsteady, at this moment, loosen screw (G) and adjust device (F). To adjust the retainer device, when needle bar is at its lowest position, let the eye of eyelet (E) be even with the surface of thread retainer device (F).

7-3 Tension of Ornament Thread

To get plenty of ornamental running, lower the eyelet (C), by loosening screw (B) and otherwise to get little of thread running. Then, retighten the screw (B).

7-4 Adjusting of Tension of Looper Thread

The standard position is that the tighten screw (E) is in the middle of eyelet (F) and (G), and eyes of eyelet (F) and (G) must be aligned.

To get plenty of casting thread, loosen fixing screw of eyelets (F) and (G) move them towards direction (L), otherwise move them towards direction (S) and retighten the fixing screws in time.

Please pay attention to that, too much plenty of casting thread will cause skip of stitch. In case of wolly thread used, thread eyelet (F) and (G) must be set fully towards direction (L) and thread should not be pressed under small thread pressing plate (H).

7-5 Positioning of Loper Thread Take-up

Lower the needle bar from the highest position by turning handwheel. When the needle bar is at the half position of looper, let the looper thread cast off from the top of looper take-up cam (I), for chemical fiber. (The needle bar should be put the bottom of looper for the cotton thread. And the needle bar should be at the one third of looper for the woolen thread.) Then retighten screw (J).

7-6 Removal and Fitting of Presser Foot

To remove presser foot:

- Loosen regulating screw (B) and fixing screw (D) of foot stopper collar(C).
- Push the presser foot lever (E) towards, then presser foot can be removed.

To fit presser foot :

- Keep a distance of 6mm between bottom face of presser foot and top of needle plate. Then fix the press foot and retighten presser foot stopper collar(C) as show in the fig.
- Reading stopper plate (A) and retighten the screw (B).

NOTE: The raising amount of presser foot of machines without ornamental thread looper is about 8mm.

And it is not necessary to use the stopper collar.

7-7 Timing of Needle with Loper Moving Right/Left

When needle bar is going up, looper must to left from its right end. When the looper begins to move towards left, needle must be going up. This timing of needle with looper moving right or left and this timing can be gained by regulating timing belt wheel.

7-8 Fitting Angle and Height of Loper

Insert looper into looper holder as far as it will go and tighten screw (B), meanwhile, fitting angle (3°) will be decided naturally.

7-9 Distance (M) between Needle and Loper at Its Right End

When needle are at their lowest position and looper is at its right end, distance (M) between center of right needle and point of looper shall be $M = 6 - A/2$, for 2-needle or 3-needle machine which the two sides distance of needle is A, for example, $A = 5.6$, $M = 3.2$.

7-10 Height of Needle

With special threads, please make adjustment as per below methods.

To adjust the height of needle bar, to open rubber plug A, and loose screw B. When needlepoint of looper move to the center of left needle, this needlepoint should be located 0.5-1mm above the needle

7-11 Relation between Needle and Stitch Plate

When the height of needle bar is set, needles must correctly formed in line as show in the illustration (solid line).

7-12 Relative Positioning of Needle and Loper in Front/Rear

a. As for three needle machine

When looper tip swings to the relative position of left needle, a clearance of 0.2–0.3mm must be kept.

When it swings to at the relative opposition of middle needle, a clearance of 0.05–0.1mm must be kept.

When looper tip is at the opposition of right needle, there will appear a soft touch. It is necessary to push the needle a little forward (0.1–0.2mm) through needle guard (rear) let it keep a clearance of 0–0.05mm.

b. As for two-needle machine

When looper tip swing to the left needle, the clear-ance will be 0.2–0.3.

When looper tip swing to the right needle, there will be appear a soft touch, it is necessary to push the needle a little forward (0.1–0.2), let it keep a clearance of 0–0.05mm.

7-13 Adjusting of Needle Guard (rear)

a. Height of needle guard (rear)

To adjust the edge (A) of needle guard (rear) to be even with the center of needle eye.

b. The correct positioning of needle guard (rear) should be as follows.

When looper tip swings to the right needle, it will push the right-needle a forward, and keep a clearance of 0–0.5mm between them. And a same clearance between the needle guard (rear) and left needle

7-14 Adjusting of Needle Guard (front)

When needle guard (front) swing to the left needle, to loosen the screw (E), let the needle guard (front) keep a clearance of 0-0.3mm with left needle.

7-15 Height of Feeding Dogs

When feeding dogs move to its highest, the surface of feeding dogs tooth should be paralleled to the top face of stitch plate and main feeding dog (B) and differential feeding dog (A) should be at the same height of 1-1.2mm.

7-16 Parallel of Feeding Dog and Stitch Plate

Remove cloth plate (small) and rear cover, then to loosen the screw (F) with a screw driver passing through hole (E) of machine body and insert a screw driver into eccentric pin (H) to turn the eccentric pin and make the feeding dog and stitch plate parallel as re-quired.

7-17 Fitting of Ornamental Looper and Its Adjusting

- When ornamental looper (A) move towards left, there should keep a clearance of 0.5–0.8mm between the hook point (a) and left needle. When it goes on moving to the left end above-mentioned clearance should be 4.5–5.5mm. All these adjustment can be made through the screw (C).
- There should keep a clearance of 9–11mm between the bottom of ornament looper (A) and top face of stitch plate, and it can be adjusted with screw (B).

7-18 Adjusting of Ornamental Thread Eyelet

On the basis of top face of looper, to adjust ornamental thread eyelet, keep a clearance of 0.5mm between ornamental thread eyelet (D) bottom and top face of looper, confirm that there is no friction and hitting during sewing, then retighten fixing screw (E).

7-19 Adjusting of Small Ornament Thread Eyelet (F)

When the needle bar drops to its lowest, to adjust the clearance between small ornamental thread eyelet bottom and top face of ornamental thread eyelet D to about 1mm, and fit the small ornamental thread eyelet eye to the extension of long eye of ornamental thread eyelet.

7-20 Adjusting of Swing Scope of Ornamental Looper

In ordinary case, the swing scope of ornamental looper is set proper before shipment. But sometimes, owing to different sewing fabric or process requirement it is necessary to make readjustment as follows:

- Remove top cover.
- Remove screw (F) and move the oil reservoir out towards (H).
- Loosen nut (K); otherwise, to move the screw (L) down, to increase swing scope, then retighten the nut (K); otherwise, to move the screw (L) up.

NOTE: During adjustment, care must be taken not to keep too big amount of swing scope, otherwise will cause the ornamental thread too loose and stitch loose and uneven.

7-21 Exchange of Upper Shaft Belt

- Remove top cover(A)
- After loosening screw (D), pull out upper shaft(E) while holding handwheel; pull upper shaft driving belt out of main shaft sprocket and as well as to remove the upper shaft from the machine.
- Loosen screw (G) on belt wheel and remove the belt wheel.
- Pull belt toward direction (K) out of the hole (R) of machine.
- To set new upper shaft driving belt, make assembling by the order of d-c-b-a in the opposite of above-mentioned. After setting, adjust the timing between looper and needle.
- After adjusting, tighten screw (D) of pulley steadily.

Collar Special–use parts for 335

No	Ret. No.	Description	Qt	Note
1	110A11000	Binding	1	
3	118110002	Tape guide	2	
4	118110004	Tape guide(short)	2	
5	118110003	Tape guide adjusting holder	2	
6	B12400432	Screw M4x4	2	
7	221F00012	Binder plug	1	
8	S150220040	Screw	2	
9	110A00013	Folder support fixing plate	1	
10	110A00012	Tape binding	1	
11	B62400812	Screw	2	
12	110150010	Fabric slide plate	1	
13	110150011	Dust cover	1	
14	S150559004	Nut M4	2	
15	110A41000	Presser foot, complete set	1	
16	110A00001	Main feed dog	1	
17	110A00002	Differential feed dog	1	
18	110A00003	Needle clamp (5.6)	1	

Seam Special-use parts for 335

No	Ret. No.	Description	Qt	Note
1	182100048	R material guide	1	
2	182100051	L material guide	1	
3	S120205001	Screw M3X6	2	
4	221100042	material guide	1	
5	B62400812	Screw M4x8	2	

Fold hem Special-use parts for 335

No	Ret. No.	Description	Qt	Note
1	221F00009	Upper folding device	1	
2	221F00008	Lower folding device	1	
4	B62400812	Screw M4X8	2	
5	221130004	Front cover plate	1	
6	S120203049	Screw M5X10	2
